

Employee Attrition Analysis – HR Director Summary

Why This Analysis Was Conducted

Employee attrition refers to employees leaving the organization. While some employee turnover is normal, a high attrition rate can increase recruitment costs, reduce productivity, and place additional pressure on existing employees. The purpose of this analysis was to understand which employees are most likely to leave and identify actions that can help improve retention.

What We Found

The analysis showed that employee turnover is not happening equally across the organization. Certain employee groups face a much higher risk of leaving than others.

Employees working as Laboratory Technicians were identified as one of the most vulnerable groups. Similarly, employees who regularly work overtime and those who travel frequently for business showed a greater tendency to leave the company. These findings suggest that workload, work-life balance, and job demands play a major role in employee retention.

The Sales department also showed a higher risk of employee turnover compared with other departments. This indicates that employees in this area may be experiencing challenges that increase the likelihood of resignation.

One important finding is that salary is not the main reason employees leave. While compensation remains important, the results indicate that work pressure, overtime requirements, travel demands, and role-specific challenges have a stronger influence on employee decisions.

What This Means for HR

The findings suggest that HR efforts should focus on improving the day-to-day employee experience rather than concentrating only on salary adjustments.

Employees who consistently work overtime may be experiencing stress, fatigue, or work-life balance issues. Frequent business travel may also contribute to dissatisfaction by reducing personal time and increasing job pressure. Addressing these concerns could significantly improve retention.

Laboratory Technicians and employees in the Sales department should be considered priority groups for retention programs because they demonstrate the highest risk of leaving.

Recommended Actions

1. Introduce workload monitoring and work-life balance initiatives for employees who frequently work overtime.
2. Conduct retention conversations with Laboratory Technicians, Sales employees, and frequent travelers.
3. Strengthen career development programs through training, mentoring, and growth opportunities.
4. Establish regular employee feedback sessions to identify concerns before employees resign.

Important Consideration

This analysis identifies patterns within company data, but it cannot capture personal reasons for leaving such as family responsibilities, health concerns, workplace relationships, or external job

opportunities. Therefore, the results should be used as a guide for decision-making rather than as the sole basis for employee-related actions.

Final Conclusion

The analysis shows that employee attrition is primarily influenced by workload, overtime, travel requirements, and specific job roles rather than salary alone. By focusing retention efforts on high-risk employee groups and improving the overall employee experience, the organization can reduce turnover, retain valuable talent, and create a more stable workforce.
